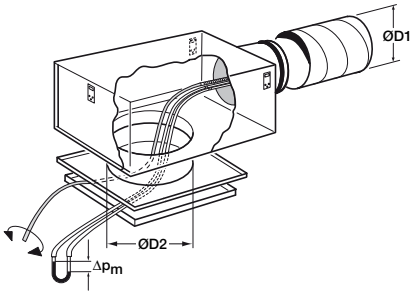
Regulation of air flow

March 2007



$$q = k\sqrt{\Delta p_m} \quad (l/s) \quad (Pa)$$

$$q = 3{,}6\ k\sqrt{\Delta p_m} \quad (m^3/h) \quad (Pa)$$

$$\Delta p_m = \left(\frac{q\ (l/s)}{k}\right)^2 \quad (Pa)$$

$$\Delta p_m = \left(\frac{q\ (m^3/h)}{3{,}6\ k}\right)^2 \quad (Pa)$$

Definitions of symbols

Symbol	Description	Unit
q_v	air volume flow	l/s, m^3/s, m^3/h
Δp_m	pressure difference	Pa
k	k-factor ($q_v = k \times \sqrt{\Delta p_m}$)	
D. d	diameter	mm
a. s	slot, position, opening	mm
L	safety distance to source of disturbance	m
n	factor of safety distance	-
m_2	inaccuracy of measurement method (error of method)	%
ρ_t	air density at the moment of measurement	kg/m^3

Methods of measurement

1. Measurement of pressure drop (Δp_m) in calibrated valves by means of measuring probe (KSO, KTS. STH...).
   The regulation is carried out by adjusting the valve opening (a) or number of holes.

2. Measurement of pressure drop (Δp_m) at a supply/exhaust valve equipped with an installed, calibrated probe SVQ...).
   The regulation is achieved by means of regulating strings by changing the damper position, at exhaust valves EHC by adjusting the slot.

3. Measurement of pressure drop (Δp_m) at a supply/exhaust valve equipped with an installed, calibrated probe (FMC, FMK...).
   The regulation is achieved by means of a separate device.

4. Measurement of pressure drop (Δp_m) at measuring devices installed permanently in the duct (IRIS).

Use of measurement and regulation guide

The guide contains the k-factors for standard products of Fläkt Woods (if necessary, the product information is also available as diagrams). For each product, information about deviating safety distances, correction factors as well as measurement and regulation actions are given in the guide.

Product-specific data of diffusion patterns. sound attenuation etc. is available in product catalogues of Fläkt Woods.
Factor k has been defined on the basis of the air volume flow unit l/s

$$q_v = k \times \sqrt{\Delta p_m} \qquad \Delta p_m = (q_v / k)^2$$

If other units of air volume flow are used. the following correction has to be made:

m^3/s: $q_v = 0.001 \times k\sqrt{\Delta p_m}$ $\Delta p_m = (q_v / (0.001 \times k))^2$

m^3/h: $q_v = 3.6 \times k\sqrt{\Delta p_m}$ $\Delta p_m = (q_v / (3.6 \times k))^2$

Example:

KSO-125. position a=+5. has to be adjusted for air volume flow $q_v = 30$ l/s
- read correction k on page 53 and 54
- insert k = 3.3 in the formula to get the pressure difference

$$\Delta p_m = (30 / 3.3)^2 = 82 \text{ Pa}$$

- adjust the valve to achieve the required pressure difference

Evaluation of measurement errors

$$m = \pm \sqrt{c_1^2 m_1^2 + c_2^2 m_2^2 + c_3^2 m_3^2 + ... + c_n^2 m_n}$$

m	relative inaccuracy of the result of measurement %
m_1	inaccuracy of the measuring instrument (device error) %
m^2	inaccuracy of the measuring method (error of method) %
m_3	reading inaccuracy of the instrument (error of observation) %
m_n	other possible inaccuracies %
$c_{1...n}$	factors for taking into account the influence of different inaccuracies on the final result. The formula takes into account the influence of random errors as well as of minor systematic errors of unknown direction. Error percentages small in comparison with other factors may be disregarded. their influence on the value of m being negligible.

Example of evaluation of the total amount of error:

m_1 = ± 4 % (information from the instrument manufacturer)
c_1 = 1/2 (measurement of pressure drop. $qv = k \times \sqrt{\Delta pm}$) *)
m_2 depends on measurement method and means of installation
c_2 = 1
m_3 = 4 % (depends on the instrument and pressure range)
c_3 = 1/2 (measurement of pressure drop) *)

*) E.g. an error of 10 % in pressure difference has an effect of about 5 % on the air volume flow.

$$m = \pm\sqrt{(1/2)^2 \times 42 + 1 \times m_2^2 + (1/2)^2 \times 4^2} = \pm \sqrt{8 + m_2^2}$$

By inserting various values on the error of method m_2. the following table is achieved:

m_2=	5	7	10	12	15	20	%
m =	5.8	7.6	10.4	12.3	15.3	20.2	%

Effect of the air density on measuring results

The k values given in the Manual are valid under normal conditions (20 °C and 101,3 kPa).
Should the measuring conditions deviate from these values, the actual air volume flow (q_{vt}) can be deduced from the air volume flow (q_v) calculated by means of the k factor as follows:

$$q_{vt} = q_v \times \sqrt{(1{,}2 \,/\, \rho_t)}$$

Ø500	6.76	10.14	13.52	16.90	20.28

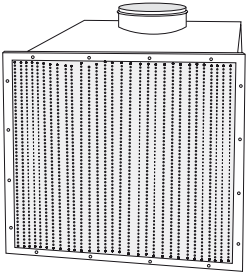
The k-values are applicable for 1m duct

UNO

nozzle/m	3	4	8	16
k-value	1.3	1.9	3.6	7.2

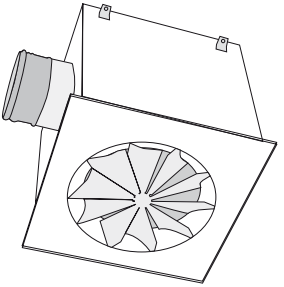
k-value is valid for air flow per m.

SPW



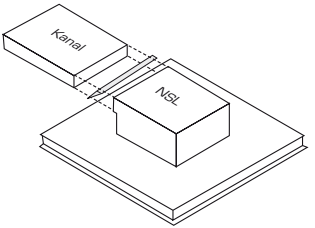
The air flow is adjusted with damper and measurement nipples.

SPN



The air flow is adjusted with damper and measurement nipples.

NSL



The air flow is adjusted with damper and measurement nipples.
